# COMPUTATION OF $\lambda$-INVARIANT 

Jangheon Oh

#### Abstract

We give an explicit formula for the computation of Iwasawa $\lambda$-invariants and an example of the computation using our method.

## 1. Introduction

Let $K$ be an imaginary quadratic field and $p$ be an odd prime. It is well-known(see [1] and [2]) that there exist non-negative integers $\lambda_{p}(K)$ and $\nu_{p}(K)$ such that the exact power of $p$ dividing the class number $h\left(K_{n}\right)$ is equal to $\lambda_{p}(K) n+\nu_{p}(K)$ for all suficiently large $n$. Here $K_{n}$ is the $n$-th layer of the cyclotomic $\mathbb{Z}_{p}$-extension of $K$. Fukuda [3] computed $\lambda_{p}(K)$ using theorems of Gold and Iwasawa's construction of $p$-adic $L$ function attached to $K$. In a paper [6], we gave another method to compute $\lambda_{p}(K)$ using Sinnott's construction of $p$-adic $L$ function and Kida's formula. Examples of computation of $\lambda_{p}(K)$ were given for $p=3$ in the paper. In this paper, we compute $\lambda_{p}(K)$ for primes greater than 5 using our method in the paper [6].

## 2. Computation of $\lambda$-invariant

We briefly explain our method in the paper [6] for computing $\lambda_{p}(K)$. Let $\Lambda$ be the ring of $\mathbb{Z}_{p}$-valued measures on $\mathbb{Z}_{p}$. Then $\Lambda$ is isomorphic to

[^0]the ring $\mathbb{Z}_{p}[[T-1]]$;explicitly, if $\alpha \in \Lambda$, then the power series associated to $\alpha$ is defined by
$$
F(T)=\sum_{n=0}^{\infty} \int_{\mathbb{Z}_{p}}\binom{x}{n} d \alpha(T-1)^{n}
$$
where $\binom{x}{n}=\frac{x(x-1) \cdots(x-n+1)}{n!}$.
Let $c>1$ be an integer prime to $p$ and the conductor of a nontrivial first kind character $\chi$ of $K$, and let $\varepsilon: \mathbb{Z} \rightarrow \mathbb{Z}_{p}$ be the function defined by $\varepsilon(a)=\chi(a)$, if $a$ is not divisible by $c$, and $\varepsilon(a)=\chi(a)(1-c)$ if $a$ is divisible by $c$. Define
$$
F_{\varepsilon}(T)=\frac{\sum_{a=1}^{f} \varepsilon(a) T^{a}}{1-T^{f}}
$$
where $f$ is any multiple of the minimal period of $\varepsilon$. It is known that $F_{\varepsilon}(T)$ lies in $\mathbb{Z}_{p}[[T-1]]$. Hence it corresponds to a measure in $\Lambda$. Let $G(T)$ be the power series in $\mathbb{Z}_{p}[[T-1]]$ corresponding to the measure
$$
\left(\left.\sum_{\eta \in V} \alpha \circ \eta\right|_{U}\right) \circ \phi,
$$
where $V$ is the group of $p$-1-th roots of unity in $\mathbb{Z}_{p}, U=1+p \mathbb{Z}_{p}$ and $\phi$ is the isomorphism $\phi: \mathbb{Z}_{p} \simeq U$ given by $\phi(y)=(1+p)^{y}$.

If $F(T)$ is an element of $\mathbb{Z}_{p}[[T-1]]$, write $F(T)=p^{\mu} F_{0}(T), F_{0}(T)=$ $\sum_{n \geq 0} a_{n}(T-1)^{n}$, where $a_{n} \not \equiv 0 \bmod p$ for some $n$. Then the $\lambda$-invariant of $\bar{F}(T)$ is defined by

$$
\lambda(F(T))=\min \left\{n: a_{n} \not \equiv 0 \bmod p\right\}
$$

Sinnott [7] proved that

$$
\lambda_{p}(K)=\lambda(G(T))
$$

when $p \geq 5$. Moreover we have Kida's formula [5]:

$$
p \lambda(G(T))=\lambda\left(\left.\sum_{\eta \in V} \alpha \circ \eta\right|_{U}\right) .
$$

In the paper [6], we computed the power series $Q(T)$ corresponding to the measure $\left.\sum_{\eta \in V} \alpha \circ \eta\right|_{U}$.

Theorem 1.

$$
Q(T)=\sum_{\eta \in V} \frac{\sum_{a \equiv \eta^{-1}}^{f} \varepsilon(a) T^{a \eta}}{1-T^{f \eta}},
$$

where $f$ is a multiple of the minimal period of $\varepsilon$ and $p$.
Proof. See the proof of Theorem 2 in [6].
To compute $\lambda(Q(T))$ explicitly, we need to replace $\eta$ by an integer $i_{\eta}$.
Lemma 1. Let $f(T)$ be in $\mathbb{Z}_{p}[[T-1]]$. Then

$$
\lambda(f(T))=\lambda\left(f\left(T^{\beta}\right)\right)
$$

for $\beta \in 1+p \mathbb{Z}_{p}$.
Proof. Note that if $f(T)$ is the power series associated to a measure $\alpha$, then $f\left(T^{\beta}\right)$ is the power series associated to a measure $\alpha \circ \beta^{-1}$. So $f\left(T^{\beta}\right)$ is in $\mathbb{Z}_{p}[[T-1]]$. We may write $f(T)=\sum_{n=0}^{\infty} a_{n}(T-1)^{n}$. By the definition of $\lambda$ we see that $a_{n} \equiv 0 \bmod p$ for $n<\lambda(f(T))$ and $a_{\lambda(f(T))} \not \equiv 0 \bmod p$. Since

$$
\begin{aligned}
T^{\beta}= & \sum_{n=0}^{\infty}\binom{\beta}{n}(T-1)^{n} \equiv 1+\beta(T-1)+\text { higher terms } \\
& \equiv T+\text { higher terms }(\bmod p),
\end{aligned}
$$

it is easy to check that $\lambda(f(T))=\lambda\left(f\left(T^{\beta}\right)\right)$.
For $\eta \in V$, let $1 \leq i_{\eta}, j_{\eta} \leq(p-1)$ be integers such that $\eta \equiv i_{\eta} \bmod p$ and $i_{\eta} j_{\eta} \equiv 1 \bmod p$. Now we give a formula to compute $\lambda$-invariants for imaginary quadratic fields.

Theorem 2. For primes $p \geq 5$, we have

$$
\lambda_{p}(K)=\frac{1}{p} \lambda\left(\sum_{\eta \in V} \frac{\sum_{a \equiv j_{\eta}}^{f} \varepsilon(a) T^{a i_{\eta}}}{1-T^{f i_{\eta}}}\right) .
$$

Proof.

$$
\begin{aligned}
\lambda_{p}(K) & =\lambda(G(T))=\frac{1}{p} \lambda\left(\left.\sum_{\eta \in V} \alpha \circ \eta\right|_{U}\right) \\
& =\frac{1}{p} \lambda(Q(T))=\frac{1}{p} \lambda\left(\sum_{\eta \in V} \frac{\sum_{a \equiv j_{\eta}}^{f} \varepsilon(a) T^{a i_{\eta}}}{1-T^{f i_{\eta}}}\right)
\end{aligned}
$$

The last equality comes from Lemma 1 with $\beta=\eta^{-1} i_{\eta}$.
We give an example.

Example 1. For $K=\mathbb{Q}(\sqrt{-127})$ and $p=5$, we can choose $c=$ $2, f=1270$. Moreover, $\varepsilon(a)=\left(\frac{a}{127}\right)(-1)^{a+1}$, where $\left(\frac{*}{*}\right)$ is the Jacobi symbol. Hence we have

$$
\begin{aligned}
\lambda_{5}(\mathbb{Q}(\sqrt{-127})) & =\frac{1}{5} \lambda\left(\frac{\sum_{a \equiv 1(5)}^{1270} \varepsilon(a) T^{a}}{1-T^{1270}}+\frac{\sum_{a \equiv 3(5)}^{1270} \varepsilon(a) T^{2 a}}{1-T^{2 * 1270}}\right. \\
& \left.+\frac{\sum_{a \equiv 2(5)}^{1270} \varepsilon(a) T^{3 a}}{1-T^{3 * 1270}}+\frac{\sum_{a \equiv 4(5)}^{1270} \varepsilon(a) T^{4 a}}{1-T^{4 * 1270}}\right) . \\
& =\frac{1}{5} \lambda\left((T-1)^{10}+(T-1)^{11}+\text { higher terms }(\bmod \mathrm{p})\right)=2,
\end{aligned}
$$

which agrees with the Table 1 of [4]. We used Maple for the second equality.
