# A FEW RESULTS ON JANOWSKI FUNCTIONS ASSOCIATED WITH $k$-SYMMETRIC POINTS 

Fuad S Al Sarari, Sridhar Latha, and Maslina Darus

#### Abstract

The purpose of the present paper is to introduce and study new subclasses of analytic functions which generalize the classes of Janowski functions with respect to $k$-symmetric points. We also study certain interesting properties like covering theorem, convolution condition, neighborhood results and argument theorem.

## 1. Introduction

Let $\mathcal{A}$ denote the class of functions of form

$$
\begin{equation*}
f(z)=z+\sum_{n=2}^{\infty} a_{n} z^{n} \tag{1.1}
\end{equation*}
$$

which are analytic in the open unit disk $\mathcal{U}=\{z \in \mathbb{C}:|z|<1\}$, and $\mathcal{S}$ denote the subclass of $\mathcal{A}$ consisting of all function which are univalent in $\mathcal{U}$.

For $f$ and $g$ be analytic in $\mathcal{U}$, we say that the function $f$ is subordinate to $g$ in $\mathcal{U}$, if there exists an analytic function $w$ in $\mathcal{U}$ such that $|w(z)|<1$ with $w(0)=0$, and $f(z)=g(w(z))$, and we denote this by $f(z) \prec g(z)$. If $g$ is univalent in $\mathcal{U}$, then the subordination is equivalent to $f(0)=g(0)$

[^0]and $f(\mathcal{U}) \subset g(\mathcal{U})$. The convolution or Hadamard product of two analytic functions $f, g \in \mathcal{A}$ where $f$ is defined by (1.1) and $g(z)=z+\sum_{n=2}^{\infty} b_{n} z^{n}$, is
$$
(f * g)(z)=z+\sum_{n=2}^{\infty} a_{n} b_{n} z^{n} .
$$

For any $f \in \mathcal{A}, \rho$-neighborhood of $f(z)$ can be defined as:

$$
\begin{equation*}
\mathcal{N}_{\rho}(f)=\left\{g \in \mathcal{A}: g(z)=z+\sum_{n=2}^{\infty} b_{n} z^{n}, \sum_{n=2}^{\infty} n\left|a_{n}-b_{n}\right| \leq \rho\right\} . \tag{1.2}
\end{equation*}
$$

For $e(z)=z$, we can see that

$$
\begin{equation*}
\mathcal{N}_{\rho}(e)=\left\{g \in \mathcal{A}: g(z)=z+\sum_{n=2}^{\infty} b_{n} z^{n}, \sum_{n=2}^{\infty} n\left|b_{n}\right| \leq \rho\right\} . \tag{1.3}
\end{equation*}
$$

The idea of neighborhoods was first introduced by Goodman [14] which was further generalized by Ruscheweyh [11]. He also proved that if $f \in \mathcal{A}, \rho>0$ and $\eta$ is a complex number with $|\eta|<\rho$, and

$$
\frac{f(z)+\eta z}{1+\eta} \in \mathcal{S}^{*}
$$

then $\mathcal{N}_{\rho}(f) \subset \mathcal{S}^{*}$. Where $\mathcal{S}^{*}$ is the class of starlike functions.
Using the principle of the subordination we define the class $\mathcal{P}$ of functions with positive real part.

Definition 1.1. [7] Let $\mathcal{P}$ denote the class of analytic functions of the form $p(z)=1+\sum_{n=1}^{\infty} p_{n} z^{n}$ defined on $\mathcal{U}$ and satisfying $p(0)=1$, $\operatorname{Re} p(z)>0, z \in \mathcal{U}$.

Any function $p$ in $\mathcal{P}$ has the representation $p(z)=\frac{1+w(z)}{1-w(z)}$, where $w \in \Omega$ and

$$
\begin{equation*}
\Omega=\{w \in \mathcal{A}: w(0)=0,|w(z)|<1\} . \tag{1.4}
\end{equation*}
$$

The class $\mathcal{P}$ of functions with positive real part plays a crucial role in geometric function theory. Its significance can be seen from the fact that simple subclasses like class $\mathcal{S}^{*}$ of starlike, class $\mathcal{C}$ of convex functions, class of starlike functions with respect to symmetric points have been defined by using the concept of class of functions with positive real part.

Definition 1.2. [1] Let $\mathcal{P}[A, B]$, with $-1 \leq B<A \leq 1$, denote the class of analytic function $p$ defined on $\mathcal{U}$ with the representation $p(z)=\frac{1+A w(z)}{1+B w(z)}, z \in \mathcal{U}$, where $w \in \Omega$.

Remark: $p \in \mathcal{P}[A, B]$ if and only if $p(z) \prec \frac{1+A z}{1+B z}$.
In [6] the class $\mathcal{P}[A, B, \alpha]$ of generalized Janowski functions was introduced. For arbitrary numbers $A, B, \alpha$, with $-1 \leq B<A \leq 1$, $0 \leq \alpha<1$, a function $p$ analytic in $\mathcal{U}$ with $p(0)=1$ is in the class $\mathcal{P}[A, B, \alpha]$ if and only if
$p(z) \prec \frac{1+[(1-\alpha) A+\alpha B] z}{1+B z} \Leftrightarrow p(z)=\frac{1+[(1-\alpha) A+\alpha B] w(z)}{1+B w(z)}, w \in \Omega$.
The definition of starlike functions with respect to $k$-symmetric points is as follows.

Definition 1.3. For a positive integer $k$, let $\varepsilon=\exp \left(\frac{2 \pi i}{k}\right)$ denote the $k^{\text {th }}$ root of unity for $f \in \mathcal{A}$, let

$$
\begin{equation*}
M_{f, k}(z)=\sum_{v=1}^{k-1} \varepsilon^{-v} f\left(\varepsilon^{v} z\right) \cdot \frac{1}{\sum_{v=1}^{k-1} \varepsilon^{-v}}, \tag{1.5}
\end{equation*}
$$

be its $k$-weighted mean function.
A function $f$ in $\mathcal{A}$ is said to belong to the class $\mathcal{S}_{k}^{*}$ of functions starlike with respect to $k$-symmetric points if for every $r$ close to $1, r<1$, the angular velocity of $f$ about the point $M_{f_{k}\left(z_{0}\right)}$ is positive at $z=$ $z_{0}$ as $z$ traverses the circle $|z|=r$ in the positive direction, that is $\Re\left\{\frac{z f^{\prime}(z)}{f(z)-M_{f, k}\left(z_{0}\right)}\right\}>0$ for $z=z_{0},\left|z_{0}\right|=r$.

Definition 1.4. [12] A function $f$ in $\mathcal{S}$ is starlike with respect to $k$-symmetric points, or briefly $k$-starlike if,

$$
\begin{equation*}
\Re\left\{\frac{z f^{\prime}(z)}{f_{k}(z)}\right\}>0, z \in \mathcal{U} \tag{1.6}
\end{equation*}
$$

where

$$
\begin{equation*}
f_{k}(z)=\frac{1}{k} \sum_{v=1}^{k-1} \varepsilon^{-v} f\left(\varepsilon^{v} z\right) \tag{1.7}
\end{equation*}
$$

If $f(z)$ is defined by (1.1) then,

$$
\begin{align*}
f_{k}(z) & =z+\sum_{n=2}^{\infty} \chi_{n} a_{n} z^{n}, \quad(k=2,3, \ldots) .  \tag{1.8}\\
\chi_{n} & = \begin{cases}1, & n=l k+1, \\
0, & n \neq l k+1\end{cases} \tag{1.9}
\end{align*}
$$

Using the generalization of Janowski functions and the concept of $k$-symmetrical functions we define the following:

Definition 1.5. A function $f$ in $\mathcal{A}$ is said to belong to the class $\mathcal{S}^{k}(A, B, \alpha)$,
$(-1 \leq B<A \leq 1), 0 \leq \alpha<1$ if

$$
\frac{z f^{\prime}(z)}{f_{k}(z)} \prec \frac{1+[(1-\alpha) A+\alpha B] z}{1+B z}, z \in \mathcal{U}
$$

where $f_{k}(z)$ is defined by (1.8).
We note that for special values of $k, \alpha, A$ and $B$ yield the following classes.
$\mathcal{S}^{1}(A, B, \alpha)=\mathcal{S}(A, B, \alpha)$ is the class introduced by Polatoglu, Bolcal, Sen and Yavuz, $[6], \mathcal{S}^{k}(A, B, 0)=\mathcal{S}^{(k)}(A, B)$ is the class studied by Kwon and $\operatorname{Sim}[3], \mathcal{S}^{k}(1,-1,0)=\mathcal{S}_{k}^{*}=\mathcal{S}_{k}^{*}(1,-1)$, the class is studied by Sakaguchi [12] and etc.
Fuad Alsarari and Latha in $[5,8,13]$ studied some classes which related to Janowski type functions and symmetric points.

Definition 1.6. A function $f$ in $\mathcal{A}$ is said to belong to the class $\mathcal{K}^{k}(A, B, \alpha)$,
$(-1 \leq B<A \leq 1), 0 \leq \alpha<1$ if

$$
\frac{\left(z f^{\prime}(z)\right)^{\prime}}{f_{k}^{\prime}(z)} \prec \frac{1+[(1-\alpha) A+\alpha B] z}{1+B z}, z \in \mathcal{U} .
$$

We need the following lemmas to prove our main results.
Lemma 1.7. [6] Any function $f \in \mathcal{S}^{*}(A, B, \alpha)$ can be written in the form

$$
f(z)=\left\{\begin{array}{lll}
z(1+B w(z))^{\frac{(1-\alpha)(A-B)}{B},}, & \text { if } B \neq 0, \\
z \exp [(1-\alpha) A w(z)], & \text { if } B=0,
\end{array}\right.
$$

where $w \in \Omega$.

Lemma 1.8. [6] Let $p \in \mathcal{P}[A, B, \alpha]$, then the set of the values of $p$ is in the closed disc with center at $C(r)$ and having the radius $\rho(r)$, where

$$
\begin{cases}C(r)=\left(\frac{1-B[(1-\alpha) A+\alpha B] r^{2}}{1-B^{2} r^{2}}, 0\right), \rho(r)=\frac{(1-\alpha)(A-B) r}{1-B^{2} r^{2}} & \text { if } B \neq 0, \\ C(r)=(1,0), \rho(r)=(1-\alpha)|A| r & \text { if } B=0,\end{cases}
$$

## 2. Main results

Lemma 2.1. Let $p \in \mathcal{P}[A, B, \alpha]$. Then

$$
p(r) \leq|p(z)| \leq q(r),
$$

where

$$
p(r)= \begin{cases}\frac{1-(1-\alpha)(A-B) r-B[(1-\alpha) A+\alpha B] r^{2}}{1-B^{2} r^{2}}, & \text { if } B \neq 0  \tag{2.1}\\ 1-(1-\alpha) A r, & \text { if } B=0\end{cases}
$$

and

$$
q(r)= \begin{cases}\frac{1+(1-\alpha)(A-B) r-B[(1-\alpha) A+\alpha B] r^{2}}{1-B^{2} r^{2}}, & \text { if } B \neq 0 \\ 1+(1-\alpha) A r, & \text { if } B=0\end{cases}
$$

Proof. The set of the values of $p$ is in the closed disc with center at $C(r)=\frac{1-B[(1-\alpha) A+\alpha B] r^{2}}{1-B^{2} r^{2}}$ and having the radius $\rho(r)=\frac{(1-\alpha)(A-B) r}{1-B^{2} r^{2}}$ using Lemma 1.8, that is

$$
\begin{equation*}
\left|p-\frac{1-B[(1-\alpha) A+\alpha B] r^{2}}{1-B^{2} r^{2}}\right| \leq \frac{(1-\alpha)(A-B) r}{1-B^{2} r^{2}} \tag{2.2}
\end{equation*}
$$

Simplifying (2.2) we get the required result.

Theorem 2.2. If $f \in \mathcal{S}^{k}(A, B, \alpha)$, then

$$
f_{k}(z)= \begin{cases}z(1+B w(z))^{\frac{(1-\alpha)(A-B)}{B}}, & \text { if } B \neq 0,  \tag{2.3}\\ z \exp [(1-\alpha) A w(z)], & \text { if } B=0\end{cases}
$$

for some $w \in \Omega$, where $f_{k}$ are defined by (1.7).

Proof. Suppose that $f \in \mathcal{S}^{k}(A, B, \alpha)$, we can get

$$
\begin{equation*}
\frac{z f^{\prime}(z)}{f_{k}(z)} \prec \frac{1+[(1-\alpha) A+\alpha B] z}{1+B z} . \tag{2.4}
\end{equation*}
$$

Replacing $z$ by $\varepsilon^{\nu} z$ in (2.4), it follows that

$$
\frac{\varepsilon^{\nu} z f^{\prime}\left(\varepsilon^{v} z\right)}{f_{k}\left(\varepsilon^{\nu} z\right)} \prec \frac{1+[(1-\alpha) A+\alpha B] \varepsilon^{\nu} z}{1+B \varepsilon^{\nu} z} \prec \frac{1+[(1-\alpha) A+\alpha B] z}{1+B z} .
$$

Since $f_{k}\left(\varepsilon^{\nu} z\right)=\varepsilon^{\nu} f_{k}(z)$,

$$
\begin{equation*}
\frac{z f^{\prime}\left(\varepsilon^{\nu} z\right)}{f_{k}(z)} \prec \frac{1+[(1-\alpha) A+\alpha B] z}{1+B z}, \tag{2.5}
\end{equation*}
$$

Letting $\nu=0,1,2, \ldots, k-1$ in (2.5) and using the fact that $\mathcal{P}[A, B, \alpha]$ is a convex set, we deduce that

$$
\frac{z \frac{1}{k} \sum_{\nu=0}^{k-1} f^{\prime}\left(\varepsilon^{\nu} z\right)}{f_{k}(z)} \prec \frac{1+[(1-\alpha) A+\alpha B] z}{1+B z},
$$

or equivalently

$$
\frac{z f_{k}^{\prime}(z)}{f_{k}(z)} \prec \frac{1+[(1-\alpha) A+\alpha B] z}{1+B z},
$$

that is $f_{k} \in \mathcal{S}(A, B, \alpha)$, and by Lemma 1.7 we obtain our result.
Theorem 2.3. If $f \in \mathcal{S}^{k}(A, B, \alpha)$, then
$|f(z)| \leq\left\{\begin{array}{l}\int_{0}^{r} \frac{1+(1-\alpha)(A-B) \rho-B[(1-\alpha) A+\alpha B] \rho^{2}}{1-B^{2} \rho^{2}}(1+B \rho)^{\frac{(1-\alpha)(A-B)}{B}} d \rho, \\ \quad \text { if } B \neq 0, \\ \int_{0}^{r}[1+(1-\alpha) A \rho] \exp [(1-\alpha) A \rho] d \rho, \\ \quad \text { if } \quad B=0,\end{array}\right.$
where $|z| \leq r<1$.
Proof. Integrating the function $f^{\prime}$ along the close segment connecting the origin with an arbitrary $z \in \mathcal{U}$, and observing that a point on this segment is of the form $\zeta=\rho e^{i \theta}$, with $\rho \in[0, r]$, where $\theta=\arg z$ and $r=|z|$, we get

$$
f(z)=\int_{0}^{z} f^{\prime}(\zeta) d \zeta, z=r e^{i \theta}
$$

hence

$$
|f(z)|=\left|\int_{0}^{r} f^{\prime}\left(\rho e^{i \theta}\right) e^{i \theta} d \rho\right| \leq \int_{0}^{r}\left|f^{\prime}\left(\rho e^{i \theta}\right) e^{i \theta}\right| d \rho
$$

For an arbitrary function $f \in \mathcal{S}^{k}(A, B, \alpha)$, we have

$$
\frac{z f^{\prime}(z)}{f_{k}(z)}=p(z), \quad p \in \mathcal{P}[A, B, \alpha]
$$

we need to study the following cases:
(i) If $B \neq 0$, then there exists a function $w \in \Omega$, such that $f_{k}(z)=z(1+B w(z))^{\frac{(1-\alpha)(A-B)}{B}}$, and therefore (2.6)

$$
\begin{aligned}
& \left|f^{\prime}(z)\right| \\
& \leq \frac{1+(1-\alpha)(A-B) r-B[(1-\alpha) A+\alpha B] r^{2}}{1-B^{2} r^{2}}|1+B w(z)|^{\frac{(1-\alpha)(A-B)}{B}}, \\
& |z| \leq r<1 .
\end{aligned}
$$

Since $w \in \Omega$, we have

$$
|1+B w(z)| \leq 1+|B| r,|z| \leq r<1 .
$$

Case 1. If $B>0$, using the fact that $-1 \leq B<A \leq 1$ and $0 \leq \alpha<1$, we have

$$
|1+B w(z)|^{\frac{(1-\alpha)(A-B)}{B}} \leq(1+|B| r)^{\frac{(1-\alpha)(A-B)}{B}},|z| \leq r<1,
$$

and from (2.6) we obtain

$$
\begin{align*}
& \left|f^{\prime}(z)\right|  \tag{2.7}\\
& \leq \frac{1+(1-\alpha)(A-B) r-B[(1-\alpha) A+\alpha B] r^{2}}{1-B^{2} r^{2}}(1+|B| r)^{\frac{(1-\alpha)(A-B)}{B}}, \\
& |z| \leq r<1
\end{align*}
$$

Case 2. If $B<0$, from the fact that $-1 \leq B<A \leq 1$ and $0 \leq \alpha<1$, we have

$$
(1-|B| r)^{\frac{(1-\alpha)(A-B)}{B}} \geq|1+B w(z)| \frac{(1-\alpha)(A-B)}{B},|z| \leq r<1,
$$

and from (2.6) we obtain

$$
\begin{align*}
& \frac{1+(1-\alpha)(A-B) r-B[(1-\alpha) A+\alpha B] r^{2}}{1-B^{2} r^{2}}(1-|B| r)^{\frac{(1-\alpha)(A-B)}{B}}  \tag{2.8}\\
& \geq\left|f^{\prime}(z)\right|, \quad|z| \leq r<1 .
\end{align*}
$$

Now, combining the inequalities (2.7) and (2.8), we finally conclude that

$$
\begin{align*}
& \left|f^{\prime}(z)\right| \leq \frac{1+(1-\alpha)(A-B) r-B[(1-\alpha) A+\alpha B] r^{2}}{1-B^{2} r^{2}}(1+B r)^{\frac{(1-\alpha)(A-B)}{B}},  \tag{2.9}\\
& |z| \leq r<1 .
\end{align*}
$$

then

$$
\begin{aligned}
& |f(z)| \\
& \leq \int_{0}^{r}\left|f^{\prime}\left(\rho e^{i \theta}\right) e^{i \theta}\right| d \rho \\
& \leq \int_{0}^{r} \frac{1+(1-\alpha)(A-B) \rho-B[(1-\alpha) A+\alpha B] \rho^{2}}{1-B^{2} \rho^{2}}(1+B \rho)^{\frac{(1-\alpha)(A-B)}{B}} d \rho,
\end{aligned}
$$

that is

$$
|f(z)|
$$

$$
\leq \int_{0}^{r} \frac{1+(1-\alpha)(A-B) \rho-B[(1-\alpha) A+\alpha B] \rho^{2}}{1-B^{2} \rho^{2}}(1+B \rho)^{\frac{(1-\alpha)(A-B)}{B}} d \rho,
$$

$$
|z| \leq r<1
$$

(ii) If $B=0$, there exists a function $w \in \Omega$, such that $f_{k}(z)=$ $z \exp [(1-\alpha) A w(z)]$, and therefore

$$
\begin{equation*}
\left|f^{\prime}(z)\right| \leq[1+(1-\alpha) A r]|\exp [(1-\alpha) A w(z)]|,|z| \leq r<1 \tag{2.10}
\end{equation*}
$$

Since $|\exp [(1-\alpha) A w(z)]|=\exp [(1-\alpha) A \operatorname{Re} w(z)], z \in \mathcal{U}$, using a similar computation as in the previous case, we deduce

$$
|\exp [(1-\alpha) A w(z)]| \leq \exp [(1-\alpha) A r],|z| \leq r<1
$$

Thus, (2.10) yields

$$
\begin{equation*}
\left|f^{\prime}(z)\right| \leq[1+(1-\alpha) A r] \exp [(1-\alpha) A r],|z| \leq r<1 \tag{2.11}
\end{equation*}
$$

and hence

$$
|f(z)| \leq \int_{0}^{r}\left|f^{\prime}\left(\rho e^{i \theta}\right) e^{i \theta}\right| d \rho \leq \int_{0}^{r}[1+(1-\alpha)|A| \rho] \exp [(1-\alpha) A \rho] d \rho,
$$

that is

$$
|f(z)| \leq \int_{0}^{r}[1+(1-\alpha) A \rho] \exp [(1-\alpha) A \rho] d \rho,|z| \leq r<1
$$

Theorem 2.4. Let $f(z)=z+\sum_{n=2}^{\infty} a_{n} z^{n}$, be analytic in $\mathcal{U}$, for $-1 \leq$ $B<A \leq 1$, and $0 \leq \alpha<1$, if

$$
\sum_{n=2}^{\infty}\left\{\left(n-\chi_{n}\right)+\left|[(1-\alpha) A+\alpha B] \chi_{n}-B n\right|\right\}\left|a_{n}\right| \leq(A-B)(1-\alpha) .
$$

Then $f(z) \in \mathcal{S}^{k}(A, B, \alpha)$.
Proof. For the proof of Theorem 2.4, it suffices to show that the values for $\frac{z f^{\prime}(z)}{f_{k}(z)}$, satisfy

$$
\left|\frac{z f^{\prime}(z)-f_{k}(z)}{[(1-\alpha) A+\alpha B] f_{k}(z)-B z f^{\prime}(z)}\right| \leq 1 .
$$

Consider

$$
\begin{aligned}
& \left|\frac{z f^{\prime}(z)-f_{k}(z)}{[(1-\alpha) A+\alpha B] f_{k}(z)-B z f^{\prime}(z)}\right| \\
= & \left|\frac{\sum_{n=2}^{\infty}\left(n-\chi_{n}\right) a_{n} z^{n-1}}{[(1-\alpha) A+\alpha B]-B+\sum_{n=2}^{\infty}\left\{[(1-\alpha) A+\alpha B] \chi_{n}-B n\right\} a_{n} z^{n-1}}\right| \\
\leq & \frac{\sum_{n=2}^{\infty}\left(n-\chi_{n}\right)\left|a_{n}\right||z|^{n-1}}{(1-\alpha)(A-B)-\sum_{n=2}^{\infty}\left|[(1-\alpha) A+\alpha B] \chi_{n}-B n\right|\left|a_{n}\right||z|^{n-1}} \\
\leq & \frac{\sum_{n=2}^{\infty}\left(n-\chi_{n}\right)\left|a_{n}\right|}{(1-\alpha)(A-B)-\sum_{n=2}^{\infty}\left|[(1-\alpha) A+\alpha B] \chi_{n}-B n\right|\left|a_{n}\right|} .
\end{aligned}
$$

This last expression is bounded above by 1 if

$$
\sum_{n=2}^{\infty}\left\{\left(n-\chi_{n}\right)+\left|[(1-\alpha) A+\alpha B] \chi_{n}-B n\right|\right\}\left|a_{n}\right| \leq(1-\alpha)(A-B),
$$

hence $\left|\frac{z f^{\prime}(z)-f_{k}(z)}{[(1-\alpha) A+\alpha B] f_{k}(z)-B z f^{\prime}(z)}\right| \leq 1$, and Theorem 2.4 is proved.
Theorem 2.5. A function $f \in \mathcal{S}^{k}(A, B, \alpha)$ if and only if

$$
\begin{equation*}
\frac{1}{z}\left[f *\left\{\frac{z}{(1-z)^{2}}\left(1+B e^{i \phi}\right)-q(z)\left(1+[(1-\alpha) A+\alpha B] e^{i \phi}\right)\right\}\right] \neq 0 \tag{2.12}
\end{equation*}
$$

where
$-1 \leq B<A \leq 1,0 \leq \alpha<10 \leq \phi<2 \pi$ and $q(z)$ is given by (2.17).

Proof. Suppose that $f \in \mathcal{S}^{k}(A, B, \alpha)$, then

$$
\frac{z f^{\prime}(z)}{f_{k}(z)} \prec \frac{1+[(1-\alpha) A+\alpha B] z}{1+B z},
$$

if and only if

$$
\begin{equation*}
\frac{z f^{\prime}(z)}{f_{k}(z)} \neq \frac{1+[(1-\alpha) A+\alpha B] e^{i \phi}}{1+B e^{i \phi}} \tag{2.13}
\end{equation*}
$$

For all $z \in \mathcal{U}$ and $0 \leq \phi<2 \pi$. It is easy to know the condition (2.13) can be written as

$$
\begin{equation*}
\frac{1}{z}\left[z f^{\prime}(z)\left(1+B e^{i \phi}\right)-f_{k}(z)\left(1+[(1-\alpha) A+\alpha B] e^{i \phi}\right)\right] \neq 0 \tag{2.14}
\end{equation*}
$$

on the other hand, it well known that

$$
\begin{equation*}
z f^{\prime}(z)=f(z) * \frac{z}{(1-z)^{2}} \tag{2.15}
\end{equation*}
$$

and

$$
\begin{equation*}
f_{k}(z)=f(z) * q(z) \tag{2.16}
\end{equation*}
$$

where

$$
\begin{equation*}
q(z)=\frac{1}{k} \sum_{v=0}^{k-1} \frac{z}{1-\varepsilon^{v} z} . \tag{2.17}
\end{equation*}
$$

Substituting (2.15) and (2.16) into (2.14) we get (2.12).
To find some neighborhood results for the class $f \in \mathcal{S}^{k}(A, B, \alpha)$ analogous to those obtained by Ruschewegh [11], we introduce the following concept of neighborhood

Definition 2.6. For $-1 \leq B<A \leq 1,0 \leq \alpha<1,0 \leq \phi<2 \pi$ and $\rho \geq 0$ we define $\mathcal{N}^{k}(A, B, \alpha ; f, \rho)$ the neighborhood of a function $f \in \mathcal{A}$ as
$\mathcal{N}^{k}(A, B, \alpha ; f, \rho)=$

$$
\begin{aligned}
\{g \in \mathcal{A}: g(z) & =z+\sum_{n=2}^{\infty} b_{n} z^{n}, d(f, g) \\
& \left.=\sum_{n=2}^{\infty} \frac{\left(n-\chi_{n}\right)+\left|[(1-\alpha) A+\alpha B] \chi_{n}-B n\right|}{(1-\alpha)(A-B)}\left|b_{n}-a_{n}\right| \leq \rho\right\},
\end{aligned}
$$

where $f(z)=z+\sum_{n=2}^{\infty} a_{n} z^{n}$ and $\chi_{n}$ is defined by (1.9).
Remark 2.7. For parametric values $k=A=-B=1$, and $\alpha=0$ (2.18) reduces to (1.2).

Theorem 2.8. Let $f \in \mathcal{A}$, and for all complex number $\eta$, with $|\mu|<$ $\rho$, if

$$
\begin{equation*}
\frac{f(z)+\eta z}{1+\eta} \in \mathcal{S}^{k}(A, B, \alpha) . \tag{2.19}
\end{equation*}
$$

Then

$$
\mathcal{N}^{k}(A, B, \alpha ; f, \rho) \subset \mathcal{S}^{k}(A, B, \alpha)
$$

Proof. We assume that a function $g$ defined by $g(z)=\sum_{n=2}^{\infty} b_{n} z^{n}$ is in the class $\mathcal{N}^{k}(A, B, \alpha ; f, \rho)$. In order to prove the theorem, we only need to prove that $g \in \mathcal{S}^{k}(A, B, \alpha)$. We would prove this claim in next three steps.
We first note that Theorem 2.5 is equivalent to

$$
\begin{equation*}
f \in \mathcal{S}^{k}(A, B, \alpha) \Leftrightarrow \frac{1}{z}\left[\left(f * t_{\phi}\right)(z)\right] \neq 0, \quad z \in \mathcal{U} \tag{2.20}
\end{equation*}
$$

where

$$
t_{\phi}(z)=\frac{\frac{z}{(1-z)^{2}}\left(1+B e^{i \phi}\right)-q(z)\left(1+[(1-\alpha) A+\alpha B] e^{i \phi}\right)}{(1-\alpha)(B-A) e^{i \phi}},
$$

where $0 \leq \phi<2 \pi,-1 \leq B<A \leq 1,0 \leq \alpha<1$ and $q$ is given by (2.17). We can write $t_{\phi}(z)=z+\sum_{n=2}^{\infty} t_{n} z^{n}$,
where

$$
\begin{equation*}
t_{n}=\frac{\left(n-\chi_{n}\right)+\left|[(1-\alpha) A+\alpha B] \chi_{n}-B n\right|}{(1-\alpha)(B-A) e^{i \phi}}, \tag{2.21}
\end{equation*}
$$

and where $\chi_{n}$ is defined by (1.9). Secondly we obtain that (2.19) is equivalent to

$$
\begin{equation*}
\left|\frac{f(z) * t_{\phi}(z)}{z}\right| \geq \rho, \tag{2.22}
\end{equation*}
$$

because, if $f(z)=z+\sum_{n=2}^{\infty} a_{n} z^{n} \in \mathcal{A}$ and satisfy (2.19), then (2.20) is equivalent to

$$
t_{\phi} \in \mathcal{S}^{k}(A, B, \alpha, \sigma) \Leftrightarrow \frac{1}{z}\left[\frac{f(z) * t_{\phi}(z)}{1+\eta}\right] \neq 0, \quad|\eta|<\rho .
$$

Thirdly letting $g(z)=z+\sum_{n=2}^{\infty} b_{n} z^{n}$ we notice that

$$
\begin{aligned}
\left|\frac{g(z) * t_{\phi}(z)}{z}\right| & =\left|\frac{f(z) * t_{\phi}(z)}{z}+\frac{(g(z)-f(z)) * t_{\phi}(z)}{z}\right| \\
& \geq \rho-\left|\frac{(g(z)-f(z)) * t_{\phi}(z)}{z}\right|, \quad(\text { by using }(2.22)) \\
& =\rho-\left|\sum_{n=2}^{\infty}\left(b_{n}-a_{n}\right) t_{n} z^{n}\right|, \\
& \geq|z| \sum_{n=2}^{\infty}\left[\frac{\left(n-\chi_{n}\right)+\left|[(1-\alpha) A+\alpha B] \chi_{n}-B n\right|}{(1-\alpha)(B-A) e^{i \phi}}\right]\left|b_{n}-a_{n}\right|
\end{aligned}
$$

$$
\geq \rho-\rho=0, \quad \text { by applying (2.21). }
$$

This prove that

$$
\frac{g(z) * t_{\phi}(z)}{z} \neq 0, \quad z \in \mathcal{U} .
$$

In view of our observations (2.20), it follows that $g \in \mathcal{S}^{k}(A, B, \alpha)$. This completes the proof of the theorem.

When $k=A=-B=1$ and $\alpha=0$ in the above theorem we get (1.3) proved by Ruschewyh in [11].

Corollary 2.9. Let $\mathcal{S}^{*}$ be the class of starlike functions. Let $f \in \mathcal{A}$ and for all complex number $\eta$, with $|\mu|<\rho$, if

$$
\begin{equation*}
\frac{f(z)+\eta z}{1+\eta} \in \mathcal{S}^{*} \tag{2.23}
\end{equation*}
$$

then $\mathcal{N}_{\sigma}(f) \subset \mathcal{S}^{*}$.
Theorem 2.10. Let $f \in \mathcal{S}^{k}(A, B, \alpha)$. Then
$\left|\arg f^{\prime}(z)\right| \leq\left\{\begin{aligned} & \frac{(A-B)(1-\alpha)}{B} \arcsin (B r) \\ &+\arcsin \left(\frac{(A-B)(1-\alpha)}{1-B[(1-\alpha) A+\alpha B] r^{2}}\right), \text { if } \quad B \neq 0, \\ &(1-\alpha) A r+\arcsin ((1-\alpha) A r), \text { if } \quad B=0,\end{aligned}\right.$
where
Proof. Suppose that $f \in \mathcal{S}^{k}(A, B, \alpha)$, then

$$
\begin{equation*}
\left|\arg f^{\prime}(z)\right| \leq\left|\arg \frac{f_{k}(z)}{z}\right|+|\arg p(z)| \tag{2.24}
\end{equation*}
$$

where $p \in P[A, B, \alpha]$, using Theorem 2.2 for $B \neq 0$, we have

$$
\frac{f_{k}(z)}{z}=(1+B w(z))^{\frac{(1-\alpha)(A-B)}{B}},
$$

we discuss the following cases Case (1), $B>0$.

$$
\begin{aligned}
& \left|(1+B w(z))^{\frac{[(1-\alpha) A+\alpha B]-B}{B}}\right| \\
& =\left|\exp \left\{\frac{[(1-\alpha) A+\alpha B]-B}{B} \log (1+B w(z))\right\}\right| \\
& =\exp \left\{\frac{[(1-\alpha) A+\alpha B]-B}{B} \log |(1+B w(z))|\right\} \\
& =|(1+B w(z))|^{\frac{[(1-\alpha) A+\alpha B]-B}{B}} \\
& \leq(1+B r)^{\frac{[(1-\alpha) A+\alpha B]-B}{B}} .
\end{aligned}
$$

Case (2) $B<0$.
Let $B=-C, C>0$. Then

$$
\begin{aligned}
\left|(1+B w(z))^{\frac{[(1-\alpha) A+\alpha B]-B}{B}}\right| & =\left|\left\{(1-C w(z))^{-1}\right\}^{\frac{[1-\alpha) A-\alpha C]+C}{C}}\right| \\
& =\left|(1-C w(z))^{-1}\right|^{\frac{[(1-\alpha) A-\alpha C]+C}{C}} \\
\leq & \left(\frac{1}{1-C r}\right)^{\frac{[(1-\alpha) A-\alpha C]+C}{C}} \\
& =(1+B r)^{\frac{[(1-\alpha) A+\alpha B]-B}{B}} .
\end{aligned}
$$

Combining the cases (1) and (2), we get

$$
\begin{aligned}
& \left|\arg \left(\frac{f_{k}(z)}{z}\right)\right| \\
& \leq \frac{[(1-\alpha) A+\alpha B]-B}{B}|\arg (1+B r)| \\
& \leq \frac{[(1-\alpha) A+\alpha B]-B}{B} \arcsin (B r) .
\end{aligned}
$$

For $B=0$ it is clear

$$
\begin{equation*}
\left|\arg \left(\frac{f_{k}(z)}{z}\right)\right| \leq(1-\alpha) A r . \tag{2.26}
\end{equation*}
$$

Now using (2.2) in Lemma 2.1 for $p \in P[A, B, \alpha]$, we have

$$
\begin{equation*}
\left|p-\frac{1-B[(1-\alpha) A+\alpha B] r^{2}}{1-B^{2} r^{2}}\right| \leq \frac{(1-\alpha)(A-B) r}{1-B^{2} r^{2}}, \tag{2.27}
\end{equation*}
$$

from which it follows that

$$
\begin{equation*}
|\arg p(z)| \leq \arcsin \left(\frac{(1-\alpha)(A-B) r}{1-B[(1-\alpha) A+\alpha B] r^{2}}\right) \tag{2.28}
\end{equation*}
$$

For $B=0$, directly we get

$$
\begin{equation*}
|\arg p(z)| \leq \arcsin ((1-\alpha) A r) \tag{2.29}
\end{equation*}
$$

From (2.25), (2.26), (2.28) and (2.29) we get the proof.
